## Markov Chains Intro II

Note 22 Recall that a Markov chain is defined with the following: the state space  $\mathscr{X}$ , the transition matrix *P*, and the initial distribution  $\pi_0$ . This implicitly defines a sequence of random variables  $X_n$  with distribution  $\pi_n$ , which denote the state of the Markov chain at timestep *n*. This sequence of random variables also obey the Markov property: the transition probabilities only depend on the current state, and not any prior states.

The stationary distribution (or the invariant distribution) of a Markov chain is the row vector  $\pi$  such that  $\pi P = \pi$ . (That is, transitioning does not change the distribution of states.)

**Irreducibility**: A Markov chain is *irreducible* if one can reach any state from any other state in a finite number of steps.

**Periodicity**: In an irreducible Markov chain, we define the *period* of a state *i* as

$$d(i) = \gcd\{n > 0 \mid P^n(i,i) = \mathbb{P}[X_n = i \mid X_0 = i] > 0\}$$

If d(i) = 1 for all *i*, then a Markov chain is *aperiodic*. Otherwise, we say that the Markov chain is *periodic*.

**Fundamental Theorem of Markov Chains**: If a Markov chain is irreducible and aperiodic, then for any initial distribution  $\pi_0$ , we have that  $\pi_n \to \pi$  as  $n \to \infty$ , and  $\pi$  is the unique invariant distribution for the Markov chain.

#### 1 Markov Chain Terminology

Note 22 In this question, we will walk you through terms related to Markov chains. Consider the following Markov chain.

(a) For what values of *a* and *b* is the above Markov chain irreducible? Reducible?

(b) For a = 1, b = 1, prove that the above Markov chain is periodic.

- (c) For 0 < a < 1, 0 < b < 1, prove that the above Markov chain is aperiodic.
- (d) Construct a transition probability matrix using the above Markov chain.

(e) Write down the balance equations for this Markov chain and solve them. Assume that the Markov chain is irreducible.

### 2 Allen's Umbrella Setup

Note 22

Every morning, Allen walks from his home to Soda, and every evening, Allen walks from Soda to his home. Suppose that Allen has two umbrellas in his possession, but he sometimes leaves his umbrellas behind. Specifically, before leaving from his home or Soda, he checks the weather. If it is raining outside, he will bring exactly one umbrella (that is, if there is an umbrella where he currently is). If it is not raining outside, he will forget to bring his umbrella. Assume that the probability of rain is *p*.

(a) Model this as a Markov chain. What is  $\mathscr{X}$ ? Write down the transition matrix. (*Hint*: You should have 3 states. Keep in mind that our goal is to construct a Markov chain to solve part (c).)

(b) Determine if the distribution of  $X_n$  converges to the invariant distribution, and compute the invariant distribution.

(c) In the long term, what is the probability that Allen walks through rain with no umbrella?

## 3 Three Tails

Note 22 You flip a fair coin until you see three tails in a row. What is the average number of heads that you'll see until getting *TTT*?

*Hint*: It can help to start by thinking about how to compute the number of *coins* flipped until getting *TTT*, and then slightly modifying your equations to solve the original question.
