### Review.

Theory: If you drink alcohol you must be at least 18.

Which cards do you turn over?

Drink Alcohol ⇒ "≥ 18"

"< 18"  $\Longrightarrow$  Don't Drink Alcohol. Contrapositive.

(A) (B) (C) and/or (D)?

Propositional Forms:  $\land, \lor, \neg, P \Longrightarrow Q \equiv \neg P \lor Q$ .

Truth Table. Putting together identities. (E.g., cases, substitution.)

Predicates, P(x), and quantifiers.  $\forall x, P(x)$ .

DeMorgan's:  $\neg (P \lor Q) \equiv \neg P \land \neg Q$ .  $\neg \forall x, P(x) \equiv \exists x, \neg P(x)$ .

# Quick Background, Notation and Definitions!

Integers closed under addition.

 $a.b \in Z \implies a+b \in Z$ 

alb means "a divides b".

2|4? Yes! Since for q = 2, 4 = (2)2.

7|23? No! No q where true.

4|2? No!

2|-4? Yes! Since for q = 2, -4 = (-2)2.

Formally: for  $a, b \in \mathbb{Z}$ ,  $a \mid b \iff \exists g \in \mathbb{Z}$  where b = ag.

3|15 since for q = 5, 15 = 3(5).

A natural number p > 1, is **prime** if it is divisible only by 1 and itself.

A number x is even if and only if 2|x, or x = 2k for  $x, k \in \mathbb{Z}$ .

A number x is odd if and only if x = 2k + 1

#### CS70: Lecture 2. Outline.

Today: Proofs!!!

- 1. By Example.
- 2. Direct. (Prove  $P \Longrightarrow Q$ .)
- 3. by Contraposition (Prove  $P \Longrightarrow Q$ )
- 4. by Contradiction (Prove P.)
- 5. by Cases

If time: discuss induction.

### Divides.

a b means

- (A) There exists  $k \in \mathbb{Z}$ , with a = kb.
- (B) There exists  $k \in \mathbb{Z}$ , with b = ka.
- (C) There exists  $k \in \mathbb{N}$ , with b = ka.
- (D) There exists  $k \in \mathbb{Z}$ , with k = ab.
- (E) a divides b

Incorrect: (C) sufficient not necessary. (A) Wrong way. (D) the

product is an integer.

Correct: (B) and (E).

#### Last time: Existential statement.

How to prove existential statement?

Give an example. (Sometimes called "proof by example.")

П

Theorem:  $(\exists x \in N)(x = x^2)$ 

**Pf:**  $0 = 0^2 = 0$ 

Often used to disprove claim.

Homework.

### Direct Proof.

**Theorem:** For any  $a, b, c \in Z$ , if a|b and a|c then a|(b-c).

**Proof:** Assume a|b and a|c

b = aq and c = aq' where  $q, q' \in Z$ 

b-c=aq-aq'=a(q-q') Done?

(b-c)=a(q-q') and (q-q') is an integer so by definition of divides

a|(b-c)

Works for  $\forall a, b, c$ ?

Argument applies to every  $a, b, c \in Z$ .

Used distributive property and definition of divides.

Direct Proof Form:

Goal:  $P \Longrightarrow Q$ 

Assume *P*.

Therefore Q.

### Another direct proof.

```
Let D_3 be the 3 digit natural numbers.
```

Theorem: For  $n \in D_3$ , if the alternating sum of digits of n is divisible by 11, then 11|n.

```
\forall n \in D_3, (11) alt. sum of digits of n) \Longrightarrow 11|n
```

#### Examples:

```
n = 121 Alt Sum: 1 - 2 + 1 = 0. Divis. by 11. As is 121.
```

$$n = 605$$
 Alt Sum:  $6 - 0 + 5 = 11$  Divis. by 11. As is  $605 = 11(55)$ 

**Proof:** For  $n \in D_3$ , n = 100a + 10b + c, for some a, b, c.

Assume: Alt. sum: a - b + c = 11k for some integer k.

Add 99a + 11b to both sides.

$$100a+10b+c=11k+99a+11b=11(k+9a+b)$$

Left hand side is n, k+9a+b is integer.  $\implies 11|n$ .

Direct proof of  $P \Longrightarrow Q$ :

Assumed P: 11|a-b+c. Proved Q: 11|n.

## **Proof by Contraposition**

```
Thm: For n \in \mathbb{Z}^+ and d \mid n. If n is odd then d is odd.
```

n = kd and n = 2k' + 1 for integers k, k'.

what do we know about d?

Goal: Prove  $P \Longrightarrow Q$ .

Assume  $\neg Q$ 

...and prove  $\neg P$ .

Conclusion:  $\neg Q \Longrightarrow \neg P$  equivalent to  $P \Longrightarrow Q$ .

**Proof:** Assume  $\neg Q$ : d is even. d = 2k.

d|n so we have

$$n = qd = q(2k) = 2(kq)$$

n is even.  $\neg P$ 

#### The Converse

```
Thm: \forall n \in D_3, (11) alt. sum of digits of n) \Longrightarrow 11|n
```

Is converse a theorem?

 $\forall n \in D_3, (11|n) \Longrightarrow (11|alt. sum of digits of n)$ 

Yes? No?

П

# Another Contraposition...

**Lemma:** For every n in N,  $n^2$  is even  $\implies n$  is even.  $(P \implies Q)$ 

 $n^2$  is even,  $n^2 = 2k$ , ... $\sqrt{2k}$  even?

**Proof by contraposition:**  $(P \Longrightarrow Q) \equiv (\neg Q \Longrightarrow \neg P)$ 

Q = 'n is even' ......  $\neg Q =$  'n is odd'

Prove  $\neg Q \Longrightarrow \neg P$ : *n* is odd  $\Longrightarrow n^2$  is odd.

n = 2k + 1

 $n^2 = 4k^2 + 4k + 1 = 2(2k^2 + 2k) + 1.$ 

 $n^2 = 2l + 1$  where l is a natural number

... and  $n^2$  is odd!

 $\neg Q \Longrightarrow \neg P \text{ so } P \Longrightarrow Q \text{ and } ...$ 

#### Another Direct Proof.

Theorem:  $\forall n \in D_3, (11|n) \Longrightarrow (11|\text{alt. sum of digits of } n)$ **Proof:** Assume 11|n.

```
n = 100a + 10b + c = 11k \implies
99a + 11b + (a - b + c) = 11k \implies
a - b + c = 11k - 99a - 11b \implies
a - b + c = 11(k - 9a - b) \implies
a - b + c = 11\ell \text{ where } \ell = (k - 9a - b) \in Z
```

That is 11 alternating sum of digits.

Note: similar proof to other direction. In this case every  $\implies$  is  $\iff$ 

Often works with arithmetic properties ...

...not when multiplying by 0.

We have.

Theorem:  $\forall n \in \mathbb{N}', (11|\text{alt. sum of digits of } n) \iff (11|n)$ 

# Proof by Obfuscation.

noun

 $\Box$ 

noun: obfuscation; plural noun: obfuscations

the action of making something <u>obscure</u>, unclear, or <u>unintelligible</u>. "when confronted with sharp questions they resort to obfuscation"

## Proof by contradiction:form

**Theorem:**  $\sqrt{2}$  is irrational.

Must show: For every  $a, b \in \mathbb{Z}$ ,  $(\frac{a}{b})^2 \neq 2$ .

A simple property (equality) should always "not" hold.

Proof by contradiction:

Theorem: P.

$$\neg P \Longrightarrow P_1 \cdots \Longrightarrow R$$

$$\neg P \Longrightarrow Q_1 \cdots \Longrightarrow \neg R$$

$$\neg P \Longrightarrow R \land \neg R \equiv$$
False

or 
$$\neg P \Longrightarrow False$$

Contrapositive of  $\neg P \Longrightarrow False$  is  $True \Longrightarrow P$ .

Theorem *P* is true. And proven.

## Product of first k primes...

Did we prove?

- ► "The product of the first *k* primes plus 1 is prime."
- No.
- ▶ The chain of reasoning started with a false statement.

Consider example..

- $\triangleright$  2 × 3 × 5 × 7 × 11 × 13 + 1 = 30031 = 59 × 509
- ▶ There is a prime in between 13 and q = 30031 that divides q.
- ▶ Proof assumed no primes in between  $p_k$  and q. As it assumed the only primes were the first *k* primes.

#### Contradiction

**Theorem:**  $\sqrt{2}$  is irrational.

Assume  $\neg P$ :  $\sqrt{2} = a/b$  for  $a, b \in Z$ .

Reduced form: a and b have no common factors.

$$\sqrt{2}b = a$$

$$2b^2 = a^2 = 4k^2$$

 $a^2$  is even  $\implies a$  is even.

a = 2k for some integer k

$$b^2 = 2k^2$$

 $b^2$  is even  $\implies b$  is even.

a and b have a common factor. Contradiction.

### Poll: Odds and evens.

x is even, y is odd.

Even numbers are divisible by 2.

Which are even?

(A) 
$$x^3$$
 Even:  $(2k)^3 = 2(4k^3)$ 

(B)  $v^3$ 

- (C) x + 5x Even: 2k + 5(2k) = 2(k + 5k)
- (D) xy Even: 2(ky).
- (E)  $xy^5$  Even:  $2(ky^5)$ .
- (F) x + y

A, C, D, E all contain a factor of 2.

E.g., x = 2k,  $x^3 = 8k = 2(4k)$  and is even.

$$y = (2k+1)$$
.  $y^3 = 8k^3 + 24k^2 + 24k + 1 = 2(4k^3 + 12k^2 + 12k) + 1$ .

Odd times an odd? Odd.

Any power of an odd number? Odd.

Idea:  $(2k+1)^n$  has terms

- (a) with the last term being 1
- (b) and all other terms having a multiple of 2k.

## Proof by contradiction: example

**Theorem:** There are infinitely many primes.

Proof:

- Assume finitely many primes: p<sub>1</sub>,...,p<sub>k</sub>.
- Consider number

$$q = (p_1 \times p_2 \times \cdots p_k) + 1.$$

- ightharpoonup q cannot be one of the primes as it is larger than any  $p_i$ .
- ▶ q has prime divisor p(p > 1 = R) which is one of  $p_i$ .
- ightharpoonup p divides both  $x = p_1 \cdot p_2 \cdots p_k$  and q, and divides q x,
- $ightharpoonup p > p | (q-x) \implies p \le (q-x) = 1.$
- $\triangleright$  so p < 1. (Contradicts R.)

The original assumption that "the theorem is false" is false. thus the theorem is proven.

### Proof by cases.

**Theorem:**  $x^5 - x + 1 = 0$  has no solution in the rationals.

Proof: First a lemma...

**Lemma:** If x is a solution to  $x^5 - x + 1 = 0$  and x = a/b for  $a, b \in Z$ , then both a and b are even.

П

Reduced form  $\frac{a}{b}$ : a and b can't both be even! + Lemma  $\implies$  no rational solution.

**Proof of lemma:** Assume a solution of the form a/b.

$$\left(\frac{a}{b}\right)^5 - \frac{a}{b} + 1 = 0$$

Multiply by  $b^5$ ,

$$a^5 - ab^4 + b^5 = 0$$

Case 1: a odd. b odd: odd - odd +odd = even. Not possible.

Case 2: a even, b odd: even - even +odd = even. Not possible. Case 3: a odd, b even: odd - even +even = even. Not possible.

Case 4: a even, b even: even - even + even = even. Possible.

The fourth case is the only one possible, so the lemma follows.

# Proof by cases.

**Theorem:** There exist irrational x and y such that  $x^y$  is rational.

Let 
$$x = y = \sqrt{2}$$
.

Case 1:  $x^y = \sqrt{2}^{\sqrt{2}}$  is rational. Done!

Case 2:  $\sqrt{2}^{\sqrt{2}}$  is irrational.

New values:  $x = \sqrt{2}^{\sqrt{2}}$ ,  $y = \sqrt{2}$ .

•

$$x^{y} = \left(\sqrt{2}^{\sqrt{2}}\right)^{\sqrt{2}} = \sqrt{2}^{\sqrt{2}*\sqrt{2}} = \sqrt{2}^{2} = 2.$$

Thus, we have irrational x and y with a rational  $x^y$  (i.e., 2).

One of the cases is true so theorem holds.

Question: Which case holds? Don't know!!!

# Be really careful!

Theorem: 1 = 2

**Proof:** For x = y, we have

$$(x^2 - xy) = x^2 - y^2$$

$$x(x - y) = (x + y)(x - y)$$

$$x = (x + y)$$

$$x = 2x$$

$$1 = 2$$

Poll: What is the problem?

- (A) Assumed what you were proving.
- (B) No problem. Its fine.
- (C) x y is zero.
- (D) Can't multiply by zero in a proof.

Dividing by zero is no good. Multiplying by zero is wierdly cool!

Also: Multiplying inequalities by a negative.

 $P \Longrightarrow Q$  does not mean  $Q \Longrightarrow P$ .

# Poll: proof review.

Which of the following are (certainly) true?

- (A)  $\sqrt{2}$  is irrational.
- (B)  $\sqrt{2}^{\sqrt{2}}$  is rational.
- (C)  $\sqrt{2}^{\sqrt{2}}$  is rational or it isn't.
- (D)  $(2^{\sqrt{2}})^{\sqrt{2}}$  is rational.
- (A),(C),(D)
- (B) I don't know.

# Summary: Note 2.

Direct Proof:

To Prove:  $P \Longrightarrow Q$ . Assume P. Prove Q.

a|b and  $a|c \implies a|(b-c)$ .

By Contraposition:

To Prove:  $P \Longrightarrow Q$  Assume  $\neg Q$ . Prove  $\neg P$ .

 $n^2$  is odd  $\implies n$  is odd.  $\equiv n$  is even  $\implies n^2$  is even.

By Contradiction:

П

To Prove: P Assume  $\neg P$ . Prove False.

 $\sqrt{2}$  is rational.

 $\sqrt{2} = \frac{a}{b}$  with no common factors....

By Cases: informal.

Universal: show that statement holds in all cases.

Existence: used cases where one is true.

Either  $\sqrt{2}$  and  $\sqrt{2}$  worked.

or  $\sqrt{2}$  and  $\sqrt{2}^{\sqrt{2}}$  worked.

Careful when proving!

Don't assume the theorem. Divide by zero. Watch converse. ...

### Be careful.

Theorem: 3 = 4

**Proof:** Assume 3 = 4.

Start with 12 = 12.

Divide one side by 3 and the other by 4 to get

4 = 3

By commutativity theorem holds.

What's wrong?

Don't assume what you want to prove!

## CS70: Note 3. Induction!

Poll. What's the biggest number?

- (A) 100
- (B) 101
- (C) n+1
- (D) infinity.
- (E) This is about the "recursive leap of faith."
